🏠 / The DevNet Developer Environment / Introduction

Introduction

2.0.1

Why Should I Take this Module?   🔖

The Cisco Networking Academy is excited for you to start your career path into an area that combines the skills needed for software development, network engineering and network and infrastructure automation. As more devices and networks use software to help program, monitor and automate things that were often done manually, a developer environment was needed to help with learning, testing and exchanging tools and resources to complete the tasks. This module introduces you to a developer environment called Cisco DevNet. You will explore different areas of the developer community to see how these tools and resources can help you in your software development and network engineering career.

At the end of each module, there will also be a quiz to see how you're retaining the information.

Note: The developer environment that you will create to do these labs, along with the developer labs that you will complete for this NetAcad version of the DEVASC course are specific to NetAcad students. You do not need to create, or use any other developer environments to achieve the objectives outlined for this course.

2.0.2

What Will I Learn to Do in this Module?

Module Title: The DevNet Developer Environment

Module Objective: Implement a development environment using DevNet resources.

Topic Title	Topic Objective
DevNet Overview	Explain how DevNet encourages communities of network programmers.
Exploring DevNet Online Resources	Investigate DevNet online resources.
